 Покажи мне – и я запомню,
 Дай мне действовать самому –
 и я научусь.

Непер Джон

Непер Джон (1550-1617 гг.) - шотландский математик, изобретатель логарифмов.

Математические труды направлены на упрощение и упорядочение арифметики, алгебры и тригонометрии. В 1614 году Непер издал труд «Описание удивительной таблицы логарифмов», в котором не только дал определение логарифма, описал его свойства, но и предложил таблицы логарифмов синусов, косинусов и тангенсов. Также Непер открыл логарифмическую кривую. Позднее им была изобретена логарифмическая линейка, которой пользовались до 70-х годов XX века.

Бюрги Йест (1552 - 1632)

Бюрги Йест (1552 - 1632) – швейцарский часовщик и мастер астрономических приборов, любитель математики. Именно Й. Бюрги составил первые таблицы логарифмов, но долгое время не решался опубликовать их. Эта медлительность стоила Бюрги приоритета.

В 1614 году в Англии Джон Непер, знатный шотландский земледelec, опубликовал книгу "Описание удивительных таблиц логарифмов". Свою книгу "Таблицы арифметической и геометрической прогрессии с обстоятельным наставлением, как пользоваться ими при всякого рода вычислениях" Бюрги издал только в 1620 году.

Логарифмы в музыке

Алгебра – сестра гармонии,
а композиторы – первые программисты.

“Музыка может возвышать или умиротворять
душу,
Живопись – радовать глаз,
Поэзия - пробуждать чувства,
Философия – удовлетворять потребности разума,
Инженерное дело – совершенствовать
материальную сторону жизни людей,
а математика способна достичь всех этих
целей”

- Что значит «решить уравнение»?
- Что такое корень уравнения?
- Какие уравнения называют логарифмическим?

• Решить уравнение – это значит найти все его корни (решения) или установить, что их нет.

• Корнем (решением) уравнения называется число, которое при подстановке в уравнение превращает его в верное равенство.

• Логарифмические уравнения – уравнения, содержащие неизвестное под знаком логарифма.

При решении логарифмических уравнений часто используются следующие методы:

- Решение уравнений на основании определения логарифма, например, уравнение $a^x = b$ ($a > 0, a \neq 1, b > 0$) имеет решение $x = \log_a b$.
- Метод потенцирования, т.е. переход от уравнения $\log_a f(x) = \log_a \varphi(x)$ к уравнению следствию $f(x) = \varphi(x)$;
- Метод введения новых переменных;
- Метод логарифмирования, т.е. переход от уравнения $f(x) = \varphi(x)$ к уравнению $\log_a f(x) = \log_a \varphi(x)$;
- Применение основного логарифмического тождества
- Метод приведения логарифмов к одному и тому же основанию.

Домашнее задание:

1. Подготовить реферат на тему: «Зачем нужны логарифмы.»
2. Определите метод решения и решите №№ 379(а;б), 380(а,б).
Проработать весь теоретический материал и разобрать примеры §19.
3. Если вы получили оценку «4»или «5», то выполните №348-349.
4. Если вы получили «3» или «2», то прочитайте и выучите основные формулы из § 15-18, выполните из учебника № 368-370 (четные), № 377, №378

$$\begin{array}{r} \frac{1}{2} 500 \\ \times 42 \\ + 210 \\ \hline 105000 \end{array}$$

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

$$\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c}$$

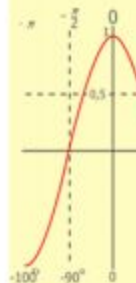

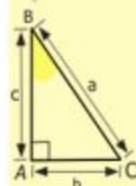

$$\sin 90^\circ = 1$$

$$\begin{cases} y = \sin 90 \\ x = 25y + 45 \end{cases}$$

$$\begin{cases} y = 1 \\ x = 25 + 45 \\ \hline x = 70 \end{cases}$$

$$(x+y)(x-y) = x^2 - y^2$$

$$y = \cos$$

Рефлексия

- У каждого из вас на столе карточки
- (зеленая, желтая, красная). Оцените свою деятельность на уроке.
- Карточка **зеленого** цвета обозначает: «Я удовлетворен уроком, урок был полезен для меня, я много с пользой и хорошо работал на уроке и получил заслуженную оценку, я понимал все о чем говорилось и что делалось на уроке».
- Карточка **желтого** цвета обозначает: «Урок был интересен, я принимал в нем активное участие, мне было на уроке достаточно комфортно».
- Карточка **красного** цвета обозначает: «Пользы от урока я получил мало, мне было не интересно, к ответам на уроке я был не готов».
