

AIR POLLUTION

by Igor Lavruschik

The problem concerns everyone

Today we are surrounded by ecological problems. In my opinion one of the most important is the air pollution. This touches all of us, because we are forced to breathe it.

Causes of pollution

The major sources of pollution in big cities are exhaust gases of cars. Sulfur oxides may cause acid rains and many other bad things. Power stations, plants, exhaust gases excrete toxic metals, radioactive pollutants.

Than dangerous sulfur oxides

Sulfur oxides may cause greenhouse effect. Around the Earth we have an ozone layer which saves us from the harmful effect of ultraviolet radiation. All the wastes we throw into the air destroy the ozone layer and more radiation gets into the atmosphere. Greenhouse effect which results in global warming.

My city one of the most polluted cities in Russia. The plant throws out in atmosphere Sulfur oxides it causes acid rains, early leaf fall. Here it is difficult to breathe. After the war, in the city of bald hills and trees can not grow.

Solution to the problem.

There is a solution for these problems: people might start using ecological friendly fuels, low-waste and non-waste technology, using bicycle more than private cars. We must to start now, otherwise we might have to face many global disasters.

Questions:

How can we solve the air pollution problem?

That is the main source of pollution in big cities?

Why is the ozone layer harmful to the balance of the planet?
