

A Trip To Mars

Mars

Mars is the fourth planet from the Sun in the Solar System. It is often described as the “Red Planet”. Mars has two moons, Phobos and Deimos, which are small and irregularly shaped.

Trip to Mars is an old dream of mankind. During it travels may open new natural resources, which will improve life of humanity in the future.

Mars is unknown planet, that hides a lot of secrets. Currently we know, that life on Mars doesn't exist, but scientists continue to explore the planet.

Life on Mars is very different from life on Earth. The main difference is gravity, temperature, lack of water pressure and carbon dioxide instead of oxygen.

During a trip to Mars,
many things can go
wrong.

For example breakage
of equipment.

Large amount of
radiation and dust
storms are a threat to
human health.

Trip will be important for human civilization, if one takes the first step to another planet to colonize it later. Colonization of Mars can play a big role in saving mankind in the case of some global catastrophe on Earth, such as a collision with an asteroid.
