

Endangered species of animals

Kiwi bird

Kiwi are flightless birds endemic to New Zealand.

The kiwi is a national symbol of New Zealand

Introduced mammalian predators,
namely stoats , dogs , ferrets , and cats ,
are the number one threat to kiwi.

A detailed illustration of a brown kiwi bird standing in a field of tall grass. The bird has a long, reddish-brown beak and a small, dark eye. The background is a warm, golden-brown color, suggesting a sunset or sunrise. The overall style is that of a digital painting or illustration.

Nationwide studies show that on

average only five percent of kiwi chicks survive to adulthood

In 1851, London Zoo became the first zoo to keep kiwis.

A close-up photograph of a kiwi bird's head and neck. The bird has thick, brown, shaggy feathers. Its most prominent feature is a very long, straight, and pointed beak that extends from the base of its head towards the bottom right of the frame. The background is a soft-focus natural setting with some dry grass and foliage.

All kinds of kiwi have strong legs and tetradigitate long,

narrow beak with nostrils at the tip

The wings are not developed,
the tail is missing

A close-up photograph of a kiwi bird standing on dark, moist soil. The bird has long, brown, shaggy feathers and a long, thin, grey beak. Its legs are visible, showing a blueish-grey color. The background is dark and out of focus, with some green foliage on the left. Overlaid on the image is red text with a black outline.

Way of life they
are only crepuscular and nocturnal

nice presentation
