

The Earth is in
danger

Earth is the only place for life

- *The planet Earth is only a tiny part of the universe, but it's the only place where human beings can live.*
- *Today, our planet is in serious danger.*

The main causes of pollution of the Earth:

- deforestation
- pollution water
- air pollution
- acid rains
- extinction animal

Deforestation

An aerial photograph showing a landscape where a large portion of the forest has been cleared, leaving a vast, flat, light-green area. A distinct, darker green forest patch remains in the lower-left quadrant, with a narrow path or road leading towards it. The sky is overcast with grey clouds.

Our forests are disappearing because they are cut down or burnt. If this trend continues, one day we won't have enough oxygen to breathe.

Pollution water

- *The seas are in danger. They are filled with poison: industrial and nuclear waste, chemical fertilisers and pesticides. The Mediterranean is already nearly dead; the North Sea is following. The Aral Sea is on the brink of extinction. If nothing is done about it, one day nothing will be able to live in the seas*

Extinction animals

Every ten minutes one kind of animal, plant or insect dies out for ever. If nothing is done about it, one million species that are alive today may soon become extinct.

Air pollution

- **Air pollution is another serious problem. In Cairo just breathing the air is dangerous — equivalent to smoking two packs of cigarettes a day. The same holds true for many Russian cities. Factories emit tons of harmful chemicals. These emissions have disastrous consequences for our planet. They are the main reason for the greenhouse effect and acid rains. An even greater threat are nuclear power stations. We all know how tragic the consequences of the Chernobyl disaster are.**

Acid rains

- dying forests
- degradation of flora and fauna
- mountain landslides
- different diseases in humans

People! will not be indifferent to the
future of the Earth.

Time is running...
