Экскурс в историю

PROFOUND HYPOTHERMIA APPARATUS FOR OPEN HEART SURGERY, 1960

Surgeons began to have success with open heart surgery in the 1950s. The apparatus was developed at Lincoln's Woodhouse Hospital. It cooled patients by drawing them inside through a heat exchanger. It also allowed the heart to stop completely. It became safe and effective, allowing surgeons to repair holes in the heart and other problems. Other machines were being produced for use in lung operations.

IS STOPPED FOR 45min
NEW TECHNIQUE

A new technique for heart operations is described by the British Medical Journal today as a notable advance. The technique will allow a child to be born.

PHYSIOLOGICAL CHILD BIRTH

Since the 1950s, babies have been born in a more natural way. They are not kept in a hospital bed for a long time. They are born in a more natural position and they are born in a more natural way. They are born in a more natural way.

HEAT EXCHANGER

The heat exchanger was used to cool patients during open heart surgery. It was a metal device that allowed the patient's blood to be cooled before it was pumped back into the body.

PROFICIENT EXPERTISE

The first patient was a child with a heart defect. The child was born in 1958. The child was born with a heart defect. The child was born with a heart defect.

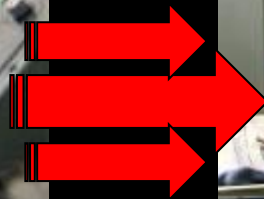

IMPROVISATION

The patient was born with a heart defect. The patient was born with a heart defect. The patient was born with a heart defect.

Возможности для России

- быстрые темпы развития за счёт оказания поддержки (интерес к Криорусу возрастает)
- опережение Европы
 - достижение уровня США

Планы по крионике

- анализ возможностей активного привлечения средств
- отработка процедуры на собаках
- расширение рядов членов организации
- в перспективе – строит-во нового здания

(Опасность смерти)
