Экскурс в историю

PROFOUND HYPOTHERMIA APPARATUS FOR OPEN HEART SURGERY, 1960

Druggan began to have successes with open heart surgery in the 1950s. His apparatus was developed at Lincoln's Inn Fields Hospital. It cooled patients by diverting their blood through a heat exchanger. It allowed Dr. Druggan to perform heart surgery completely in human cold and anesthesia, allowing surgeons time to repair holes in the heart and other problems. Other machines were being purchased for use in lung operations.

IS STOPPED FOR 45 MIN
NEW TECHNIQUE

A new technique for heart operations is described by the British Medical Journal today as a notable advance. The technique was used on a child in 1960.

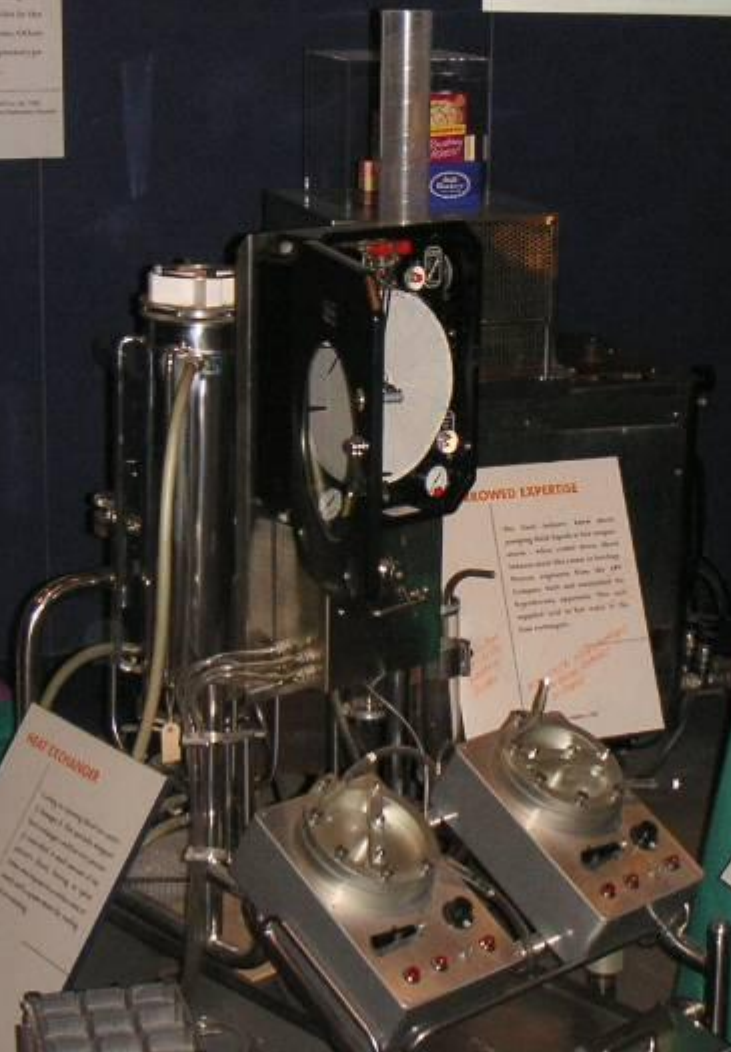

PHYSIOLOGICAL CHILD BIRTH

Since the 1950s, medical progress has advanced natural childbirth. The use of forceps and other instruments is rarely needed and the mother can choose to deliver naturally. The use of forceps and other instruments is rarely needed and the mother can choose to deliver naturally.

HEAT EXCHANGER

The heat exchanger was used to cool the patient's blood during open heart surgery. It was a key component of the hypothermia apparatus.

PROFICIENT EXPERTISE

The first patient was a child, a young girl, who was operated on in 1960. The procedure was successful and the child recovered well.

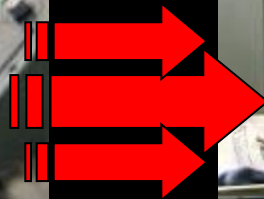

IMPROVISATION

The patient's blood was cooled through the cooling in the heat exchanger. The patient's blood was cooled through the cooling in the heat exchanger.

Возможности для России

- быстрые темпы развития за счёт оказания поддержки (интерес к Криорусу возрастает)
- опережение Европы
– достижение уровня США

Планы по крионике

- анализ возможностей активного привлечения средств
- отработка процедуры на собаках
- расширение рядов членов организации
- в перспективе – строит-во нового здания

(Опасность смерти)
