Экскурс в историю

PROFOUND HYPOTHERMIA APPARATUS FOR OPEN HEART SURGERY, 1960

Druggan began to have successes with open heart surgery in the 1950s. His apparatus was developed at Lincoln's Inn Fields Hospital. It cooled patients by diverting their blood through a heat exchanger. At about 18 Celsius the heart stopped completely. It became still and bloodless, allowing surgeons time to repair holes in the heart and other problems. Open heart cases were being performed hours long operations.

IS STOPPED FOR 45min
NEW TECHNIQUE

A new technique for heart operations is described by the British Medical Journal today as a notable advance. The technique was used on a child in 1960.

NATURAL CHILDBIRTH

Since the 1950s natural childbirth has become a popular alternative to conventional hospital childbirth. It has led to a number of different techniques, including natural childbirth, which is a form of natural childbirth, and other techniques. Natural childbirth is a form of natural childbirth, which is a form of natural childbirth.

HEAT EXCHANGER

The heat exchanger was used to cool the patient's blood during open heart surgery. It was a key component of the apparatus developed by Druggan.

PROFICIENT EXPERTISE

The first patient who died during open heart surgery was a child. The child died because of the expertise of the surgeon. The child died because of the expertise of the surgeon.

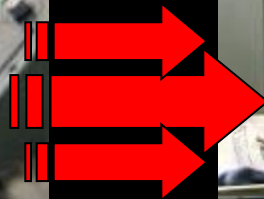

IMPROVISATION

The patient was probably immobilized by the use of the improvisation. The patient was probably immobilized by the use of the improvisation.

Возможности для России

- быстрые темпы развития за счёт оказания поддержки (интерес к Криорусу возрастает)
- опережение Европы
– достижение уровня США

Планы по крионике

- анализ возможностей активного привлечения средств
- отработка процедуры на собаках
- расширение рядов членов организации
- в перспективе – строит-во нового здания

(Опасность смерти)
