

#### **Delivering Excellence in Software Engineering**

Application server. Web server.

#### What is application server? Web server?

#### Web server:

- gets HTTP request
- sends HTTP response ( HTML page + images, etc)

#### **Application server:**

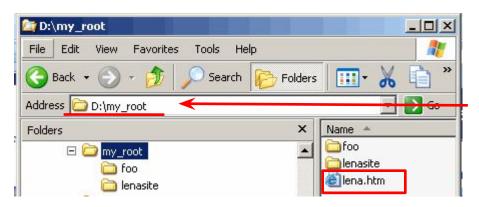

- Normally has web server functions
- Focused on server-side dynamic content
- Interaction with database

#### Servlet container:

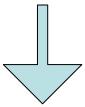

Something that can run Java servlets

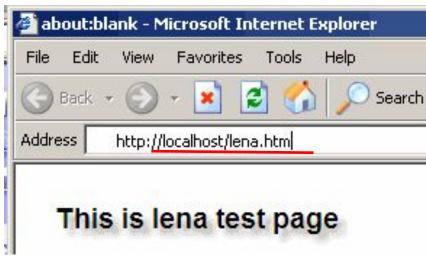

#### Web server: Path Translation

Web server root directory

## Path translation

#### What web server can do?

#### All web servers

- HTTP
- Logging

#### + Some can

- Authentication
- Handling of not only static content
- HTTPS support
- Content compression (i.e. by gzip encoding) to reduce the size of the responses (to lower bandwidth usage, etc.).
- Virtual hosting
- Large file support
- Bandwidth throttling

#### Web and application servers- examples

Application servers	Web servers
Apache Tomcat	Apache HTTP
JBoss	IIS
WebSphere	IBM HTTP server
WebLogic	Sun ONE

#### **Current Latest Versions**

Apache Tomcat: 5.5.29, 6.0.35, 7.0.23

Apache HTTP:2.0, 2.2, 2.4

• IBM HTTP (based on Apache HTTP): 6.1.0.31

#### What tester normally does with web\app servers?

#### **Basics**

- Start/stop
- Access admin GUI, check version installed
- View/delete logs
- Clear cache

#### Intern\Advanced

- Deploy application
- Configure virtual folder
- Configure HTTPS
- Configure Application server + Web server
- 2 instances on 1 box

# **Apache HTTP \IBM HTTP (on the example of Apache)**

#### Apache HTTPd: Get binary distribution for Windows

### http://apache.org/

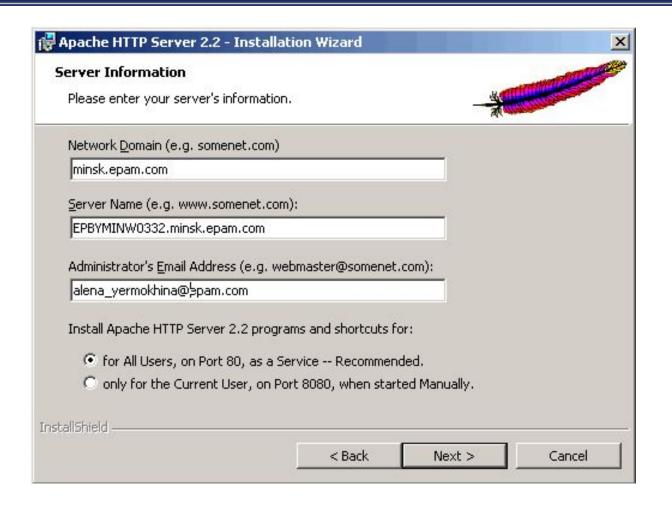

->HTTP Server ->from a mirror ->Other files ->binaries/ ->win32/-> httpd-2.2.21-win32-x86-openssl-0.9.8m-r2.msi

#### 2 choices:

- httpd-2.2.15-win32-x86-openssl-0.9.8m-r2.msi with SSL (https) support - we select this one
- httpd-2.2.15-win32-x86-no\_ssl.msi without SSL (https) support

#### Apache HTTPd: Install

#### Apache HTTPd: Start, Stop – 3 ways

1. via apache monitor in task bar

2. via services

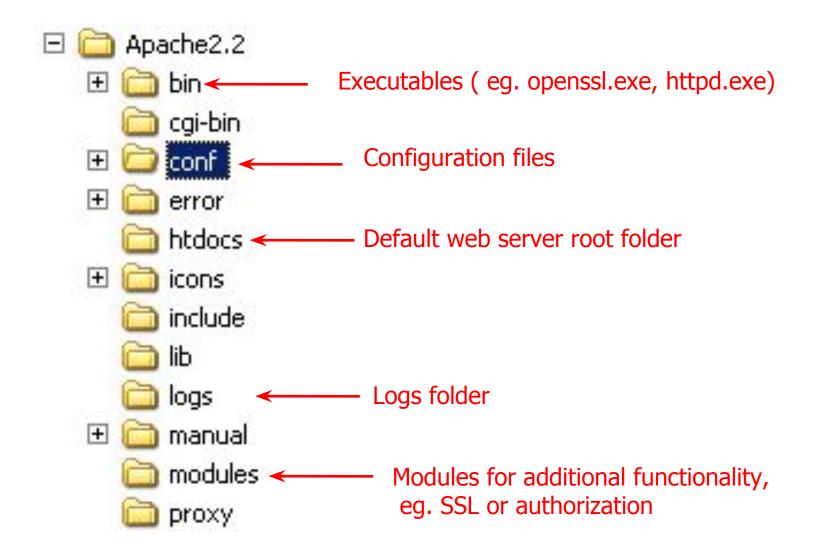

• 3. via command line: httpd ( good for troubleshooting) purposes)

```
cv C:\WINDOWS\system32\cmd.exe
C:\Program Files\Apache Software Foundation\Apache2.2\bin>httpd -k start
C:\Program Files\Apache Software Foundation\Apache2.2\bin>httpd -k stop
The Apache2.2 service is stopping.
The Apache2.2 service has stopped.
C:\Program Files\Apache Software Foundation\Apache2.2\bin>net start Apache2.2
The Apache2.2 service is starting.
The Apache2.2 service was started successfully.
C:\Program Files\Apache Software Foundation\Apache2.2\bin>net stop Apache2.2
The Apache2.2 service is stopping.
The Apache2.2 service was stopped successfully.
C:\Program Files\Apache Software Foundation\Apache2.2\bin>httpd -t
Syntax OK
C:\Program Files\Apache Software Foundation\Apache2.2\bin>
```

Apache2.2

#### Apache HTTPd: Important folders

#### Apache HTTPd: Log files

#### C:\Program Files\Apache Software Foundation\Apache2.2\logs

# access.log

```
Status, size
                                          What was requested
            Date/time
host
127.0.0.1 - - [17/Jan/2008:13:04:08 +0200] "GET /blablabla.htm HTTP/1.1" 404 211
127.0.0.1 - - [17/Jan/2008:13:04:23 +0200] "GET /lena.htm HTTP/1.1" 200 9
```

# error.log

[Thu Jan 17 13:03:54 2008] [warn] RSA server certificate CommonName (CN) 'test certificate' does NOT match server name!?

[Thu Jan 17 13:03:54 2008] [warn] Init: (EPBYMINW0332.minsk.epam.com:443) You configured HTTP(80) on the standard HTTPS(443) port!

[Thu Jan 17 13:03:54 2008] [notice] Child 5368: Child process is running

[Thu Jan 17 13:03:54 2008] [notice] Child 5368: Acquired the start mutex.

[Thu Jan 17 13:03:54 2008] [notice] Child 5368: Starting 250 worker threads.

[Thu Jan 17 13:03:54 2008] [notice] Child 5368: Starting thread to listen on port 80.

[Thu Jan 17 13:03:54 2008] [notice] Child 5368: Starting thread to listen on port 443.

[Thu Jan 17 13:04:08 2008] [error] [client 127.0.0.1] File does not exist: D:/apachetest/blablabla.htm

#### Apache HTTPd: main configuration file HTTPD.conf

```
#- comment
Listen 80 – port on which server listens
LoadModule ssl_module modules/mod_ssl.so – adds additional
  module (just uncomment)
DocumentRoot "D:/apachetest"
ServerName www.domain.tld
<Directory >
  Options FollowSymLinks
  AllowOverride None
  Order deny, allow
  Deny from all
  Satisfy all
</Directory>
```

#### **1.** file:

put file (eg, test.htm) here: C:\Program Files\Apache Software Foundation\Apache2.2\htdocs

Go to <a href="http://localhost/test.htm">http://localhost/test.htm</a>

#### 2. make other folder document root folder:

Httpd.conf: modify DocumentRoot modify < directory >

#### 3. make accessible folder outside DocumentRoot:

After < If Module alias\_module > , create < directory entry > Insert Alias /111 D:/111

#### HTTPd.conf: Create \change index file

- <IfModule dir\_module>
- DirectoryIndex lena.htm
- </IfModule>

#### HTTPd.conf: Change port

- Listen 81
- Listen 443

 Server can listen several ports at the same time

#### Apache: more complex tasks

- Set up SSL
- Configure Apache +Tomcat
- Configure Apache authorization

- 1. We need to generate certificate and tell web server about it
- 1. We need only test certificate ( self signed)
- 1. If user says "trust certificate, the rest is done automatically, by browser/server

#### Apache HTTPd: Configuring SSL

- Make sure openSSL installed
- Get certificate
  - private key
  - certificate signing request
  - certificate
  - certificate in DER form
- HTTPD.conf:
  - Listen port 443
  - Turn on SSL

**Detailed instructions: Apache and SSL.doc** 

#### Why this is needed?

- Apache has better performance for production needs
- Apache: more flexibility to configure than Tomcat as web server
- Apache load balances several tomcats
- Customers have this configuration, so we may have to test it.

# **Detailed instructions:**Tomcat\_Apache\_Configuration.doc

# **Detailed instructions: Apache SSO Setup.doc**
