:: RoadMap: What Needs to be Done? ::

There is a lot to do...most of the pages are just stubs, simple placeholders waiting for you to fill them up. However here is a small roadmap of things I personally think should be developed first (again, this is a wiki so you are more than welcome to get in

PD (Pure Data)

Co

http://www.arduino.cc

Arduino Philosophy and Community

Open Source Physical Computing Platform

- "open source hardware"
- open source: free to inspect & modify
- physical computing
 - ubiquitous computing
 - pervasive computing
 - ambient intelligence
 - calm computing
 - Spimes
 - Blogjects
 - smart objects

Community-built

- Examples wiki (the "playground") editable by anyone
- Forums with lots of helpful people

Arduino Hardware

- Similar to Basic Stamp (if you know of it)
 - but cheaper, faster, & open
- Uses AVR ATmega328 microcontroller chip
 - chip was designed to be used with C language
- The designer of the AVR purposefully arranged its registers and instruction set so that C programs would compile efficiently on it. This is a big deal, compared to previous microcontrollers where C programs were almost always less efficient than a hand-coded assembly language variant.

\$50

\$2

Arduino Hardware Variety

- Openness has its advantages, many different varieties.
- Anyone can build an Arduino work-alike in any form-factor they want

Arduino Capabilities

- 16 kBytes of Flash program memory
- 1 kByte of RAM
- 16 MHz (Apple II: 1 MHz)
- Inputs and Outputs
 - 14 digital input/output pins
 - 6 analog input pins
 - 6 analog output pins (pseudo-analog, uses PWM, which we'll talk about later)
- Completely stand-alone: doesn't need a computer once programmed
- * Don't worry if the above doesn't make sense, you don't really need to know it.

Arduino Types Comparison

Name	Processor	Operating / Input Voltage	CPU Speed	Analog In/Out	Digital IO / PWM	EEPROM [KB]	SRAM [KB]	Flash [KB]	UART
Ethernet	ATmega328P	5 V / 7-12 V	16 MHz	6/0	14/4	1	2	32	-
Leonardo	ATmega32U4	5 V / 7-12 V	16 MHz	12/0	20/7	1	2.5	32	1
LilyPad	ATmega328P	2.7-5.5 V	8 MHz	6/0	14/6	0.512	1	16	-
Mega ADK	ATmega2560	5 V / 7-12 V	16 MHz	16/0	54/15	4	8	256	4
Micro	ATmega32U4	5 V / 7-12 V	16 MHz	12/0	20/7	1	2.5	32	1
Mini	ATmega328P	5 V / 7-9 V	16 MHz	8/0	14/6	1	2	32	-
Nano	ATmega328P	5 V / 7-9 V	16 MHz	8/0	14/6	1	2	32	1
Uno	ATmega328P	5 V / 7-12 V	16 MHz	6/0	14/6	1	2	32	1
Yun	AR9331 Linux	5 V	400MH z	12/0	20/7	1	16MB	64 MB	1
Zero	ATSAMD21G18	3.3 V / 7-12 V	48 MHz	6/1	14/10	-	32	256	2

Arduino Uno

Microcontroller	ATmega328
Operating Voltage	5V
Input Voltage (recom)	7-12V
Input Voltage (limits)	6-20V
Digital I/O Pins	14 (6 PWM)
Analog Input Pins	6
DC Current per I/O Pin	40 mA
DC Current for 3.3V Pin	50 mA
Flash Memory	32 KB (0.5 KB bootloader)
SRAM	2 KB
EEPROM	1 KB
Clock Speed	16 MHz
Length	68.6 mm
Width	53.4 mm
Weight	25 g

Arduino Terminology

- "sketch" a program you write to run on an Arduino board
- "pin" an input or output connected to something.
 e.g. output to an LED, input from a knob.
- "digital" value is either HIGH or LOW. (aka on/off, one/zero) e.g. switch state
- "analog" value ranges, usually from 0-255. e.g.
 LED brightness, motor speed, etc.

Arduino Software

 Like a text editor
 View/write/e dit sketches
 But then you program them into hardware

Installing Arduino

- 1. Get the Arduino software & unzip it
- 2. Plug in Arduino board
- 3. Install the driver
- 4. Reboot
- 5. Run the Arduino program
- 6. Tell Arduino (program) about Arduino (board)

Plug in Arduino board

Power LED should stay on

Windows Driver Install

Mac Driver Install

Double-click on .dmg Installer

- v2_I_6 for PPC Macs
- v2_2_6 for Intel Macs

Arduino IDE

Using Arduino

- Write your sketch
- Press Compile button (to check for errors)
- Press Upload button to program
 Arduino board with your sketch

- Try it out with the "Blink" sketch!
- Load "File/Examples/Basics/Blink"

Status Messages

Uploading worked

Wrong serial port selected

Size depends on complexity of your sketch

Done uploading.

Binary sketch size: 1110 bytes (of a 14336 byte maximum)

Serial port '/dev/tty.usbserial-A4001qa8' not found. Did you select the gava.awt.eventbispatchineea.pumpeventsteventbispatchineea.gava.i/o

java.awt.EventDispatchThread.run(EventDispatchThread.java:110)

Wrong board selected

Wrong microcontroller found. Did you select the right board from the T pinary sketch size: 000 bytes (or a 2100 byte maximum)

tvrdude: Expected signature for ATMEGA8 is 1E 93 07 Double check chip, or use -F to override this check.

nerdy cryptic error messages

Troubleshooting

- Most common problem is incorrect serial port setting
- If you ever have any "weird" errors from the Arduino environment, just try again.
- The red text at the bottom is debugging output in case there may be a problem
- Status area shows summary of what's wrong

I made an LED blink, so what?

- Most actuators are switched on and off with a digital output
- The digitalWrite() command is the software portion of being able to control just about anything
- LEDs are easy, motors come in a bit
- Arduino has up to 13 digital outputs, and you easily can add more with helper chips

Development Cycle

- Make as many changes as you want
- □ Not like most web programming: edit \rightarrow run
- □ Edit → compile → upload → run

Lots of Built-in Examples

And all over the Net. Search for "Arduino tutorial" or "Arduino notes" or whatever you're interested in and "Arduino" and likely you'll find some neat pages.

Installing Arduino Library for Proteus

For Windows XP

Copy file BLOGEMBARCADO.LIB into:

C:\Program Files\Labcenter Electronics\Proteus 8 Professional\Data\LIBRARY

For Windows 7 and later

Copy file BLOGEMBARCADO.LIB into:

 $C:\ProgramData\Labcenter\ Electronics\Proteus\ 8\ Professional\LIBRARY$

Loading the compiled file to Proteus

File -> Preferences -> Show verbose output during compilation

Preferences	
Sketchbook location:	
C:\Documents and Settings\Administrator\My Documents\Arduino	Browse
Editor font size: 12 (requires restart of Arduino)	
Show verbose output during: 🔽 compilation 🦳 upload	
Delete previous applet or application folder on export	
🗖 Use external editor	
Check for updates on startup	
☑ Update sketch files to new extension on save (.pde -> .ino)	
Automatically associate .ino files with Arduino	
Yore preferences can be edited directly in the file :\Documents and Settings\Administrator\Application Data\Arduino\p i /edit only when Arduino is not running)	references.txt
ОК	Cancel

Loading the compiled file to Proteus

Select and copy the location of .hex file

Loading the compiled file to Proteus

Sells Arduino boards and lots of neat sensors & stuff

- Books:
 - "Arduino cookbook", Michael Margolis
 - "Arduino programming notebook", Brian W. Evans
 - "Getting started with Arduino", Massimo Banzi

Some Common Commands

- Serial.println(value);
 Prints the value to the Serial Monitor on your computer
- pinMode(pin, mode);
 Configures a digital pin to read (input) or write (output) a digital value
- digitalRead(pin);
 Reads a digital value (HIGH or LOW) on a pin set for input
- digitalWrite(pin, value);
 Writes the digital value (HIGH or LOW) to a pin set for output

delay(value)

Stops the program execution for amount of milliseconds given by value

Hidden Treasure

```
int main(void)
{
    init(); // initializes the Arduino hardware
    setup();
    for (;;)
        loop();
    return 0;
}
```

Tasks

- Blinking LED on 12th pin
- 3 LEDs blink by order (interval 1s)
- Traffic lights (Rd-5s, YI-1s, Gr-5s, YI-1s ...)
- 3 LEDs binary counter (0-7)
- 4 LED ripple

Arduino data types

Numeric types	Bytes	Range	Use				
int	2	-32768 to 32767	Represents positive and negative integer values.				
unsigned int	2	0 to 65535	Represents only positive values; otherwise, similar to int.				
long	4	-2147483648 to 2147483647	Represents a very large range of positive and negative values.				
unsigned long	4	4294967295	Represents a very large range of positive values.				
Numeric types	Bytes	Range	Use				
float	4	3.4028235E+38 to -3.4028235E+38	Represents numbers with fractions; use to approximate real- world measurements.				
double	4	Same as float	In Arduino, double is just another name for float.				
boolean	1	false(0) or true(1)	Represents true and false values.				
char	1	-128 to 127	Represents a single character. Can also represent a signed value between -128 and 127.				
byte	1	0 to 255	Similar to char, but for unsigned values.				
Other types							
string	Represents arrays of chars (characters) typically used to contain text.						
void	Used only in function declarations where no value is returned.						

Flow control

1. if

```
if(expression) { //if expression is true
                                                          if (inputPin < 500) {
   doSomething;
}
                                                          }
                                                          else if (inputPin >= 1000) {
2. if... else
if(inputPin == HIGH) {
                                                          }
   doThingA;
```

```
} else{
   doThingB;
```

}

3. for

```
for (initialization; condition; expression) {
   doSomething;
}
```

4. while

```
while (expression) {
   doSomething;
}
```

5. do... while do { doSomething; } while (expression);

```
Serial.println(j);
                }
while (someVariable < 200) { //if less than 200
   doSomething; // executes enclosed statements
   someVariable++; // increments variable by 1
}
do{ // assign readSensors value to x
  x = readSensors();
   delay (50); // pauses 50 milliseconds
} while (x < 100); // loops if x is less than 100
```

doThingA;

doThingB;

doThingC;

for(j=0; j < 4; j++){</pre>

else{

}

Using Floating-Point Numbers

	OUTPUT:
float value = $1.1;$	1.00
<pre>void setup(){</pre>	0.90
<pre>Serial.begin(9600);</pre>	0.80
}	0.70
void loop(){	0.60
value = value - 0.1; //reduce value by 0.1 each time through the loop	0.50
if(value == 0)	0.40
Serial.println("The value is exactly zero");	0.30
<pre>else if(fabs(value) < .0001)</pre>	0.20
//function to take the absolute value of a float	0.10
Serial.println("The value is close enough to zero");	The value is close enough
else Sorial println(value):	to zero
delav(100):	-0 10
}	-0.20

This is because the only memory-efficient way that floating-point numbers can contain the huge range in values they can represent is by storing an approximation of the number. The solution to this is to check if a variable is close to the desired value.

Arrays are zero indexed, with the first value in the array beginning at index number
 0. An array needs to be declared and optionally assigned values before they can be used.

int myArray[] = {value0, value1, value2...}

 Likewise it is possible to declare an array by declaring the array type and size and later assign values to an index position

int myArray[5]; // declares integer array with 5 positions myArray[3] = 10; // assigns the 3rd index the value 10

To retrieve a value from an array, assign a variable to the array and index position:

first = myArray[0]; // this is the first element
last = myArray[4]; // this is the last element

Tasks with arrays and loops

- 3 LEDs blink by order (interval 1s)
- Traffic lights (Rd-5s, YI-1s, Gr-5s, YI-1s ...)
- 3 LEDs binary counter (0-7)
- 4 LED ripple
