- Одной из основных и простейших фигур в геометрии является четырехугольник.
- За несколько тысячелетий геометры так подробно изучили четырехугольник, что иногда говорят о «геометрии четырехугольника» как о самостоятельном разделе геометрии.

**Дано:** ABCD - прямоугольник,

**Доказать:**  $AC=BD$ .

**Доказательство**

Рассмотрим  $\triangle CDA$  и  $\triangle BAD$ :

1. AD – общая,

2. CD = BA – противоположные стороны прямоугольника,

3.  $\angle CDA = \angle BAD$  ( по  $90^\circ$ ), значит  $\triangle CDA = \triangle BAD$ .

Из равенства треугольников следует равенство его соответствующих сторон,

значит  $AC=BD$ .

 $AC \cap BD = O$ .

**Доказать** 1)  $AC \perp BD$ ,

2) AC и BD – биссектрисы углов ромба.

**Доказательство**

$\triangle ABC$  – равнобедренный с основанием AC,

O - середина AC (как точка пересечения диагоналей параллелограмма),  
тогда BO - медиана, значит BO – высота, и биссектриса.

Получили: 1)  $AC \perp BD$ ; 2) BD - биссектриса угла B.

Аналогично доказывается, что BD – биссектриса угла D

и AC - биссектриса углов A и C.
