# ***Acute leukemia.***

- **Originated from bone marrow (>25% blasts).**
- **Usually monoclonal disease.**
- **Lineage committed morphology (FAB classif.)**
- **B and T or myeloid malignant cells are estimated by immunophenotyping (FAB classif. 1996 classif.)**
- **Cytogenetic abnormalities (WHO classif. 2001,2008).**
- **Fusion genes as markers of disease diagnosis and prognosis.**

# ***Acute leukemia***

*(WHO classification, 2008).*

- **Mixed phenotype acute leukemia (T or B- myeloid, NK-cell...)**
- **B lymphoblastic leukemia/lymphoma with t(9:22)(q34;q11.2); *BCR-ABL1*.**
- **B lymphoblastic leukemia/lymphoma with t (v;11q23); *MLL* rearranged.**
- **B lymphoblastic leukemia/lymphoma with t(12;21)(p13;q22) *TEL-AML1 (ETV6-RUNX1)***
- **B lymphoblastic leukemia/lymphoma with hyperdiploidy.**
- **B lymphoblastic leukemia/lymphoma with hypodiploidy.**
- **B lymphoblastic leukemia/lymphoma with t(5;14)(q31;q32); *IL-3-IgH***
- **B lymphoblastic leukemia/lymphoma with t (1;19)(q23;p13.3); *TCF-PBX1***
- **T lymphoblastic leukemia/lymphoma.**

# ***Chronic lymphocytic leukemia***

*(WHO classification, 2008).*

- **Mature B-cell neoplasms**

- Chronic lymphocytic leukemia/small lymphocytic lymphoma,

- B-cell prolymphocytic leukemia,

- Splenic marginal zone lymphoma,

- Hairy cell leukemia,

- Lymphoplasmacytic lymphoma,

- Waldenstrom macroglobulinemia,

- Heavy chain diseases,

- Plasma cell myeloma,

- -MALT lymphoma,

- Follicular lymphoma,

- Diffuse large B-cell lymphoma,

- Plasmablastic lymphoma,

- Burkitt lymphoma.

# ***Chronic lymphocytic leukemia***

*(WHO classification, 2008).*

- **Mature T-cell and NK-cell neoplasms:**
  -  T-cell prolymphocytic leukemia,
  -  T-cell large granular lymphocytic leukemia,
  -  Aggressive NK-cell leukemia,
  -  Adult T-cell leukemia/lymphoma,
  -  Mycosis fungoides,
  -  Sezary syndrome,
  -  Primary cutaneous CD30+ T cell lymphoproliferative disorders,
  -  Peripheral T-cell lymphoma,
  -  Anaplastic large cell lymphoma...

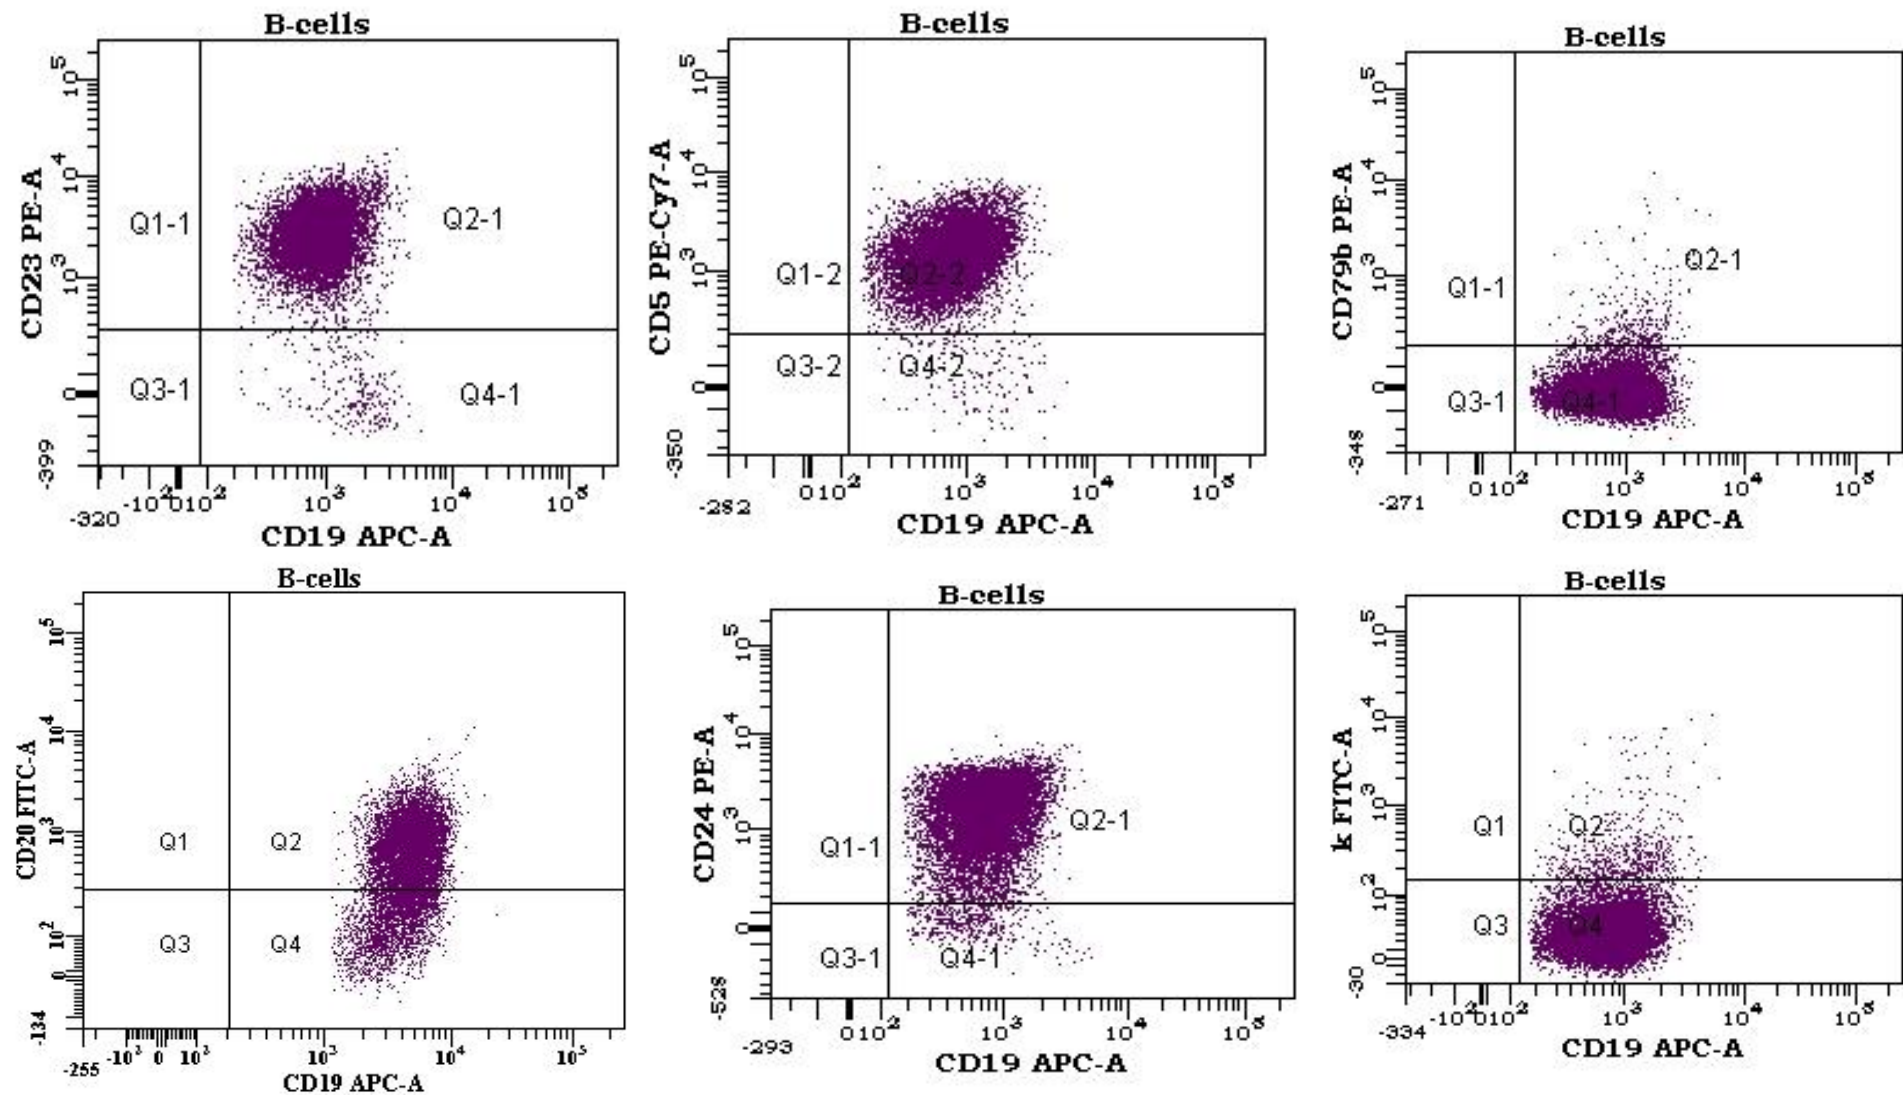

# Adverse prognostic factors of CLL

- Diffuse infiltration of bone marrow by lymphocytes;
- Advanced age;
- Male gender;
- Deletions in chr.17p (p53!) or 11q (ATM !) (5-10% of pts for each) ;
- High serum level of beta-2 – microglobulin;
- Increased fraction of prolymphocytes in PB;
- >20% of ZAP-70-positive cells, >30% CD38+ cells;
- No rearrangement in IgH V region.

## Favorable prognostic factors

- No diffuse infiltration of bone marrow by lymphocytes;
- Deletion in chr.13 q (50% of pts);
- <20% of ZAP-70-positive cells, <30% CD38+ cells;
- Mutations in IgH V region.

# Typical B cell phenotype in CLL

# Strategy for CLL therapy.

First line of therapy: Fludarabine, Cyclophosphamine, Rituximabe (FCR).

**Chemotherapy, MABs** such as alemtuzumab (directed against CD52) and ofatumumab (directed against CD20) are also used.

**Stem cell transplantation** – rare.

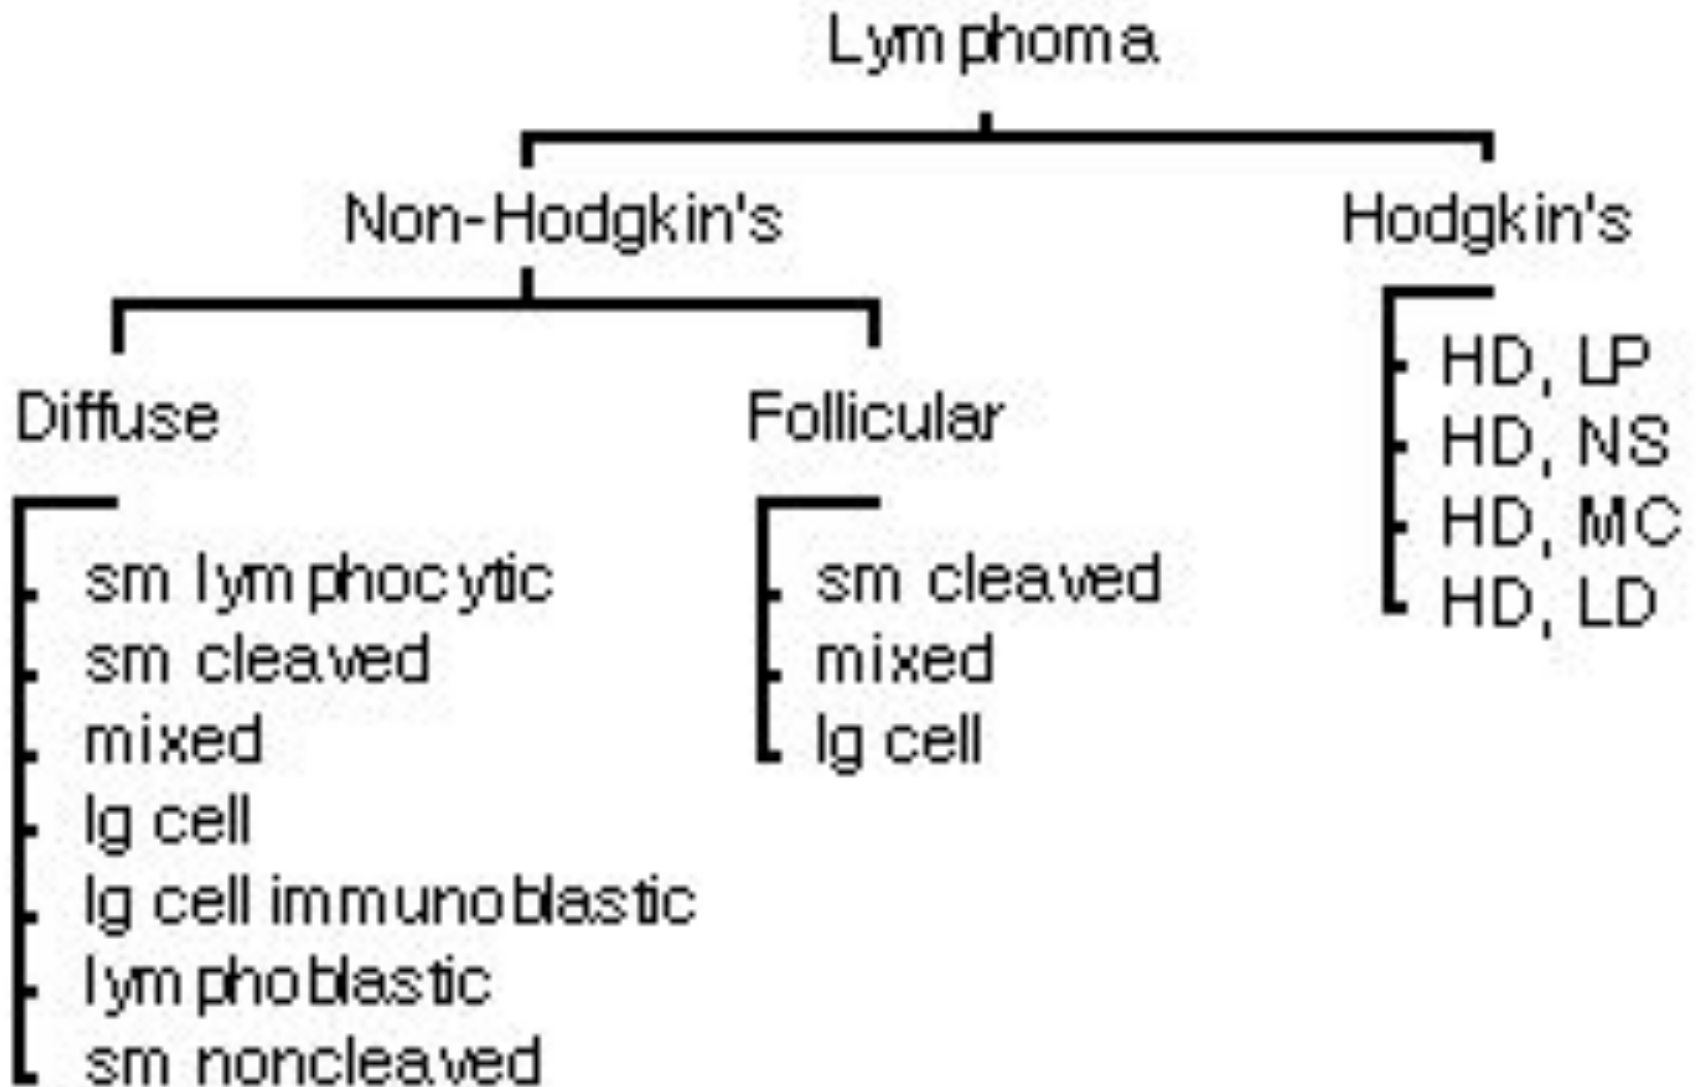

## **Survival:**

Subclinical “disease” can be identified in 3,5% of normal adults and up to 7% of individuals over the age of 70.

Survival rate depends on subtypes (6-8 years to 22 years).

# Types of lymphomas.

# ***Hodgkin Lymphoma et al. (WHO, 2008).***

- **Hodgkin lymphoma:**
  - classical Hodgkin lymphoma,
  - Lymphocyte-rich classical Hodgkin lymphoma, ...
- **Histiocytic and dendritic cell neoplasms:**
  - histiocytic sarcoma,
  - Langerhans cell histiocytic,
  - Follicular dendritic cell sarcoma,...
- **Posttransplantation lymphoproliferative disorders:**
  - plasmacytic hyperplasia,
  - Infectious mononucleous-like PTLD,
  - polymorphic PTLD,
  - monomorphic PTLD (B- and T/NK-cell types),...

# Histological diagnosis of HD.

**The Reed–Sternberg cells are identified as large often bi-nucleated cells with prominent nucleoli and an unusual CD45-, CD30+, CD15+/- immunophenotype. In approximately 50% of cases, the Reed–Sternberg cells are infected by the Epstein–Barr virus.**

# The adverse prognostic factors for HD

**Age  $\geq$  45 years**

**Stage IV disease**

**Hemoglobin  $<$  105 g/l**

**Lymphocyte count  $<$  600/ $\mu$ l or  $<$  8%**

**Male gender**

**Albumin  $<$  40 g/l**

**White blood count  $\geq$  15,000/ $\mu$ l**

# Stages and Therapy of HD

**Stage I** is involvement of a single lymph node region (I) (mostly the cervical region) or single extralymphatic site (Ile);

**Stage II** is involvement of two or more lymph node regions on the same side of the diaphragm (II) or of one lymph node region and a contiguous extralymphatic site (Ile);

**Stage III** is involvement of lymph node regions on both sides of the diaphragm, which may include the spleen (IIIs) and/or limited contiguous extralymphatic organ or site (IIle, IIles);

**Stage IV** is disseminated involvement of one or more extralymphatic organs

**Therapy strategy:** radiation therapy +/- chemotherapy.

**Prognosis:** The 5-year survival rate for those patients with a favorable prognosis was 98%, while that for patients with worse outlooks was at least 85%

# Non-Hodgkin lymphoma

## Causes

The many different forms of lymphoma likely have different causes. These possible causes and associations with at least some forms of NHL include:

Infectious agents like Epstein-Barr virus, Human T-cell leukemia virus, Helicobacter pylori, HHV-8 and HIV infection.

Chemicals, like diphenylhydantoin, dioxin, and phenoxyherbicides.

Medical treatments like radiation therapy and chemotherapy.

Genetic diseases, like Klinefelter 's syndrome, Chediak-Higashi syndrome, ataxia-telangiectasia syndrome

Autoimmune diseases, like Sjogren's syndrome, celiac sprue, rheumatoid arthritis and systemic lupus erythematosus

**TABLE 2: Immunophenotypic and histochemical markers of B-cell lymphomas/leukemias**

	slg	clg	CD5	CD10	CD20	CD23	CD43	CD103	Cyclin D1

Enteropathy-associated T-cell lymphoma	+	+	+	-(+)	+(-)	+(-)	-	+	$\alpha/\beta \gg \gamma/\delta$
Adult T-cell leukemia/lymphoma <sup>&amp;</sup>	+	+	-	+(-)	-(+)	+(-)	-	-	$\alpha/\beta$

+ = > 90% positive; +(-) = > 50% positive; -(+) = < 50% positive; - = < 10% positive; ALCL = anaplastic large cell lymphoma; C = cytoplasmic; LGL = large granular lymphoproliferative; NK = natural killer; PLL = prolymphocytic leukemia; S = surface; TCR = T-cell-rearranged (molecular)

\* Approximately 15% to 20% of LGL cases arise from a NK lineage; they are typically CD56+ and CD16-negative.

<sup>^</sup>The anaplastic lymphoma kinase (ALK) protein is expressed in 50% to 60% of cases.

<sup>#</sup> Expanded follicular dendritic cell clusters (CD21+) are present around proliferated venules; Epstein-Barr virus (EBV) genomes are detected in most cases (eg, EBER) and may be present in either T or B cells; in addition, TCR may be negative or oligoclonal in 20% to 25% of cases, whereas B-cell immunoglobulin may be rearranged in 10% of cases.

<sup>&</sup>Adult T-cell leukemia/lymphoma cases are always associated with the presence of HTLV-I; further, CD25 is expressed in the majority of cases.

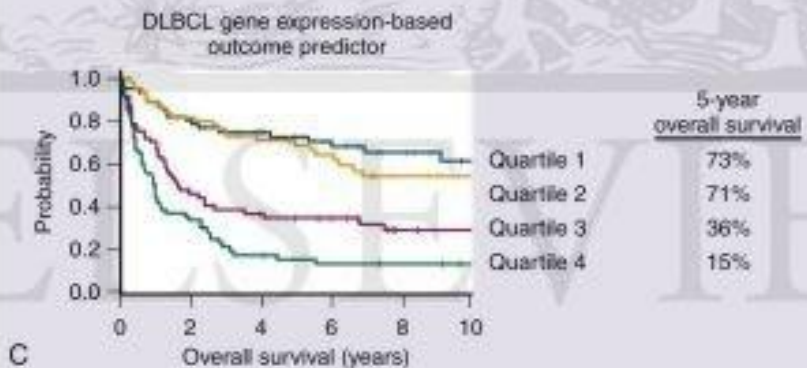

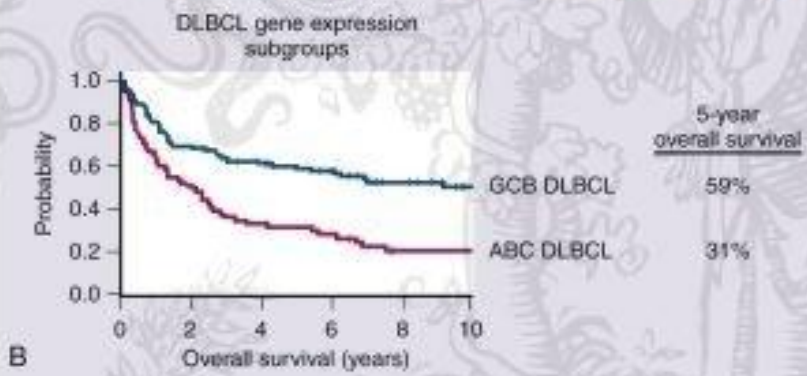

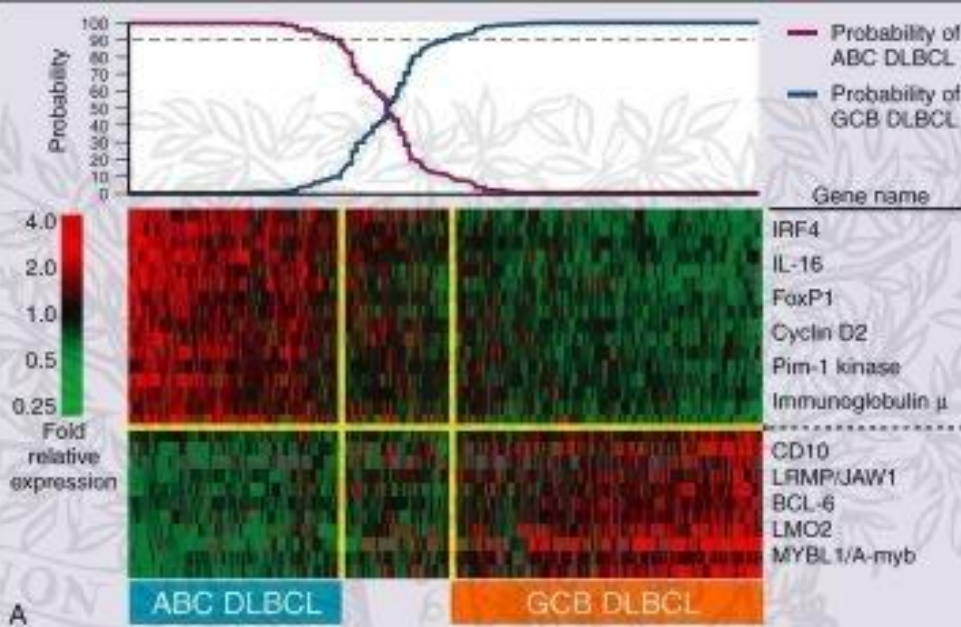

# Cytogenetic analysis for B-cell malignancies

t(11;14)(q13;q32)

t(11;14) is mainly found in mantle cell lymphoma, but also in B-prolymphocytic leukaemia, in plasma cell leukaemia, in splenic lymphoma with villous lymphocytes, in chronic lymphocytic leukaemia, and in multiple myeloma, herein briefly described; all these diseases involve a B-lineage lymphocyte

# Diagnosis of DLBCL by MicroArray technique:

Germinal center B cell DLBCL vs activated (post-germinal center) B cell DLBCL

# Burkitt's lymphoma (rare type of NHL)

(endemic= EBV positive)

Table 1

## Distinction Between Burkitt Lymphoma and Diffuse Large B-Cell Lymphoma

	Burkitt Lymphoma	Diffuse Large B-Cell Lymphoma
Epidemiology	1%–2% of adult NHL cases, much more prevalent in children than adults	30% of adult NHL cases, much more prevalent in adults than children
Morphology	Uniform round to ovoid medium sized cells with round nuclei that contains coarse chromatin and multiple nucleoli. Starry-sky appearance	Large lymphoid cells, similar in size or larger than tissue macrophages, in diffuse growth pattern
Immunophenotype	CD10+, CD19+, CD20+, CD22+, CD79a+, monotypic sIg+, CD5–, and TdT–	CD19+, CD20+, CD22+, CD45+, CD79a+, PAX5, monotypic sIg±, CD5±, and CD10±
Proliferation fraction by Ki-67	Nearly to 100%	53%
Genetics	<i>c-myc</i> +, <i>Bcl-6</i> +, <i>Bcl-2</i> –	<i>Bcl-2</i> (15%–30%), <i>Bcl-6</i> (20%–40%), <i>c-myc</i> (5%–15%)
Treatment	Short course of intensive chemotherapy (CODOX-M/IVAC±R, HyperCVAD±R)	CHOP-R

HyperCVAD = hyperfractionated cyclophosphamide, vincristine, doxorubicin (Adriamycin), dexamethasone; CHOP = cyclophosphamide, doxorubicin, vincristine, prednisone; CODOX-M/IVAC = cyclophosphamide, vincristine, doxorubicin, methotrexate, ifosfamide, etoposide, cytarabine; NHL = non-Hodgkin lymphoma; R = rituximab.

# Immunophenotypic diagnosis of Burkitt's lymphoma

The cells of BL typically express monotypic surface IgM, CD19, CD20, CD22, CD10, Bcl-6, and CD79a, and are negative for CD5, CD23, Bcl-2, and nuclear terminal deoxyribonucleotide transferase (TdT). Lack of surface immunoglobulin has been reported in a few cases. The presence of CD10 and Bcl-6 expression supports the germinal center-cell stage of differentiation.

A remarkable feature of BL is the high growth fraction (> 95%) as demonstrated by Ki-67. The leukemic cells of BL express a mature immunophenotype that distinguishes it from precursor B-cell acute lymphoblastic leukemia (ALL).

# T (8,14) in Burkitt's lymphoma

# Path from Normal plasma cells through Monoclonal Gammopathy of Undetermined Significance to Multiple Myeloma.

Cumulative-Damage

Random Second-Hit Dependent Conversion

Normal to MGUS

MGUS to MM

**Primary Cytogenetic Abnormalities**

IgH translocation at 14q32 (~50% of MGUS)  
Hyperdiploidy (~50% of MGUS)

# Multiple Myeloma diagnosis and therapy.

- Diagnosis: Roentgen + BM biopsy+..
- Therapy: chemotherapy, BMT.
- Survival: 5-8 years.

# Serum paraprotein detection

**Serum Protein Electrophoresis**

# M-protein and diseases.

More than 50% of patients with serum M protein have an initial clinical diagnosis of MGUS ( M protein <30g/l in serum, +10% plasma cells in BM). The prevalence of MGUS increases with age, from approximately 1% in patients 50 to 60 years old to greater than 5% in those older than 70 years. The age-adjusted prevalence is higher in males than in females and is twice as high in patients of African descent as in patients of European descent

# Waldenstrom macroglobulinemia: pathogenesis

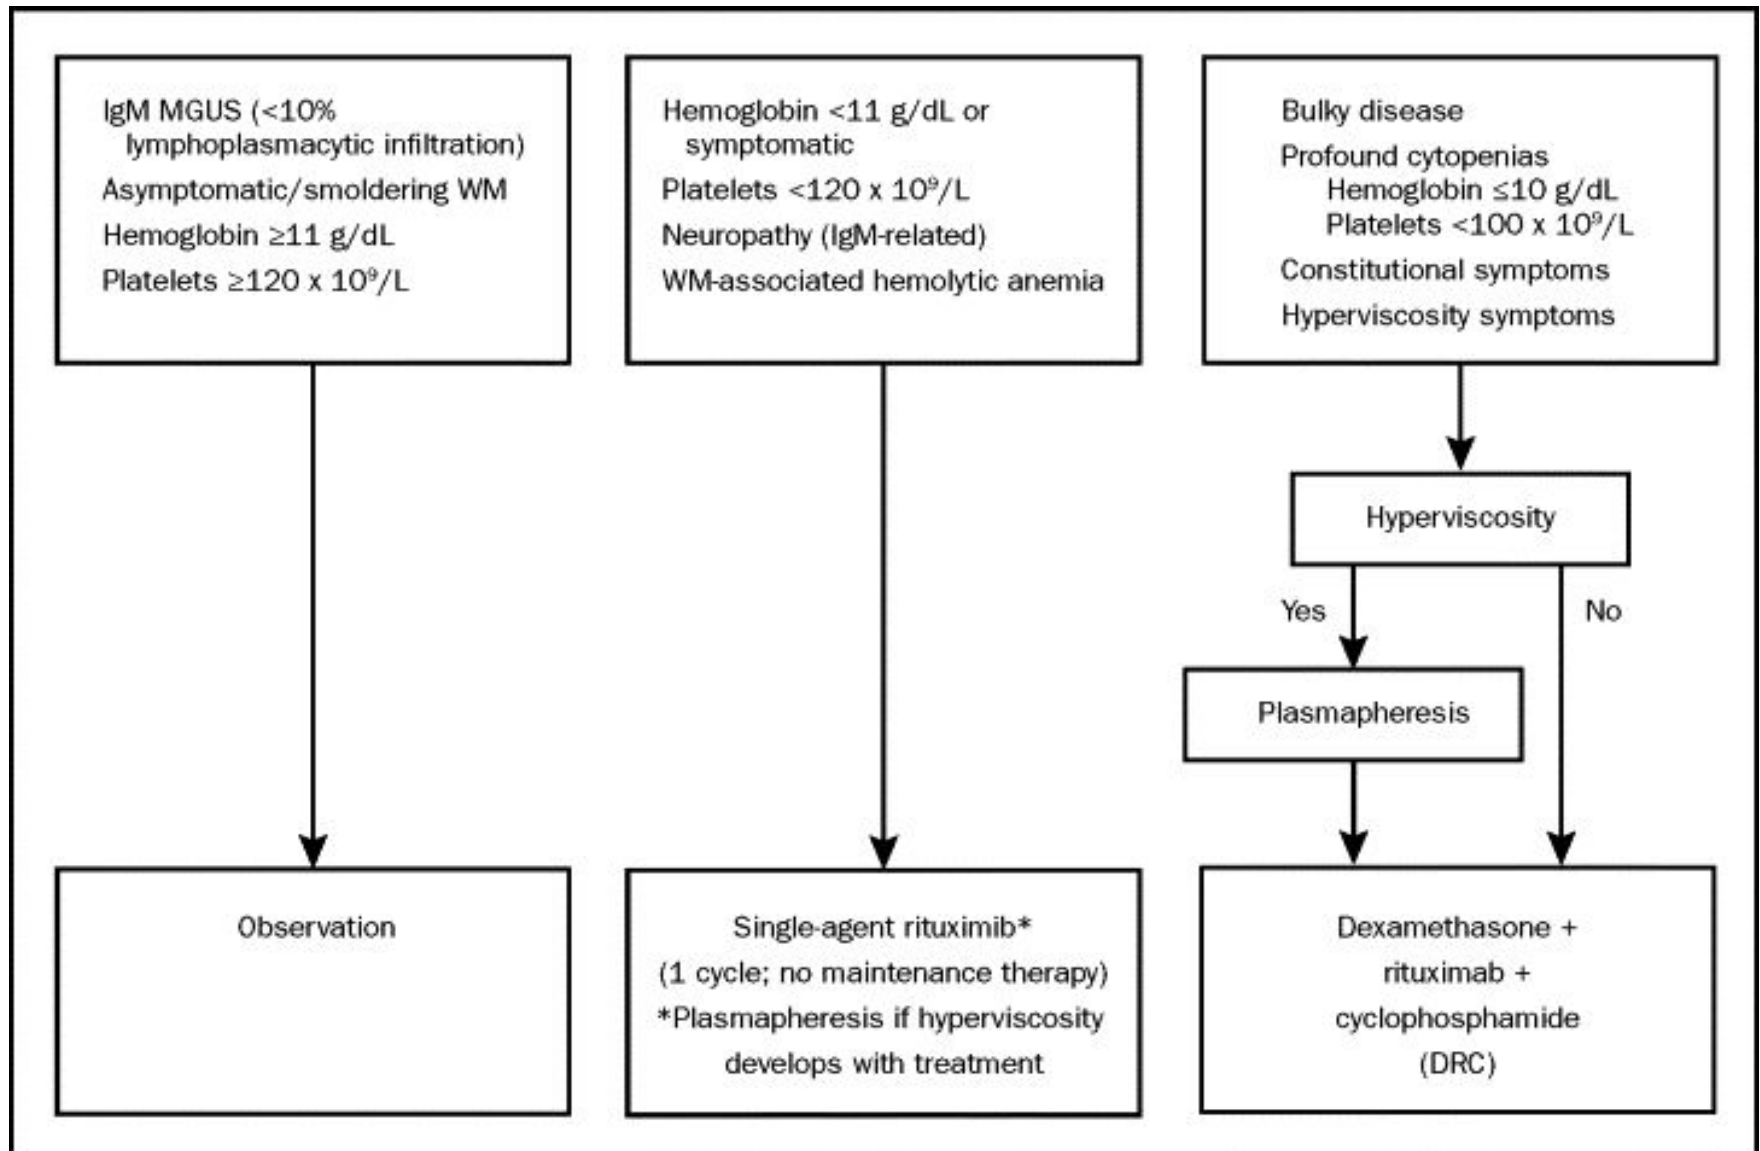

## Immunophenotype of BM cells in WM

Ig light chain	- Positive
CD19	- Positive
CD20	- Positive
CD52	- Positive
Surface IgM	- Positive
CD79b	- Positive
CD11c	- Usually negative
CD25	- Positive
CD23	- Usually negative
CD38	- Dim positive
FMC7	- Usually dim positive
CD22	- May be positive
CD5	- Negative
CD10	- Negative
CD27	- Dim positive
CD75	- Usually negative
CD138	- Usually negative
Bcl2	- Dim positive
Bcl6	- Usually absent
PAX5+	- Dim positive
CD45 (RA)	- Usually positive

# Diagnosis and Therapy of WM.

# Light chain Disease

(Bence-Jones proteins).

A **Bence Jones protein** is a monoclonal globulin protein or immunoglobulin light chain found in the urine, with a molecular weight of 22-24 kDa. Detection of Bence Jones protein may be suggestive of Multiple Myeloma or Waldenstrom's macroglobulinemia.

# (Bence-Jones protein in serum/urine (up) and serum (down))

**A**

Patient 1

**B**

Patient 2

# HEAVY CHAIN DISEASE

**Heavy chain disease** is a form of paraproteinemia with a proliferation of cells producing immunoglobulin heavy chains

**There are four forms:**

alpha chain disease (Seligmann's disease)

gamma chain disease (Franklin's disease)

mu chain disease

delta chain disease

# Secondary immunodeficiency in lymphoproliferative diseases.

- 1. Lymphadenopathy (decreased lymphocyte proliferation to mitogens, T cell subpopulation imbalance).
- 2. Autoimmunity (autoantibodies, amyloidosis, renal and liver failure, coagulopathy, vasculitis).
