...flowers generally are composed of four parts, or whorls, arranged in alternating rings along the stem. The whorls are called the sepals, petals, and stamens. The petals are the colorful parts of the flower that attract insects and other animals. The stamens are the male parts of the flower. The pistil is the female part of the flower. It is made up of the ovary, style, and stigma. The ovary contains the ovules, which are the eggs. The style is the tube that connects the ovary to the stigma. The stigma is the part of the flower that catches the pollen. The pollen is the male part of the flower. It is made up of the anther and the filament. The anther is the part of the stamen that produces the pollen. The filament is the part of the stamen that holds the anther. The flower is made up of the petals, sepals, stamens, and pistil. The petals are the colorful parts of the flower that attract insects and other animals. The sepals are the green parts of the flower that protect the petals. The stamens are the male parts of the flower. The pistil is the female part of the flower. It is made up of the ovary, style, and stigma. The ovary contains the ovules, which are the eggs. The style is the tube that connects the ovary to the stigma. The stigma is the part of the flower that catches the pollen. The pollen is the male part of the flower. It is made up of the anther and the filament. The anther is the part of the stamen that produces the pollen. The filament is the part of the stamen that holds the anther. The flower is made up of the petals, sepals, stamens, and pistil.

**sepals** sepals

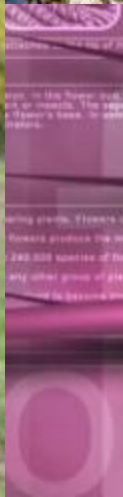

The sepals, the whorled leaves, together are called the calyx. They are the green parts of the flower that protect the petals. They are also the parts of the flower that are most likely to be eaten by insects and other animals. They are also the parts of the flower that are most likely to be used for food. They are also the parts of the flower that are most likely to be used for medicine. They are also the parts of the flower that are most likely to be used for decoration. They are also the parts of the flower that are most likely to be used for art. They are also the parts of the flower that are most likely to be used for science. They are also the parts of the flower that are most likely to be used for education. They are also the parts of the flower that are most likely to be used for entertainment. They are also the parts of the flower that are most likely to be used for recreation. They are also the parts of the flower that are most likely to be used for relaxation. They are also the parts of the flower that are most likely to be used for stress relief. They are also the parts of the flower that are most likely to be used for mood improvement. They are also the parts of the flower that are most likely to be used for mental health. They are also the parts of the flower that are most likely to be used for physical health. They are also the parts of the flower that are most likely to be used for emotional health. They are also the parts of the flower that are most likely to be used for spiritual health. They are also the parts of the flower that are most likely to be used for intellectual health. They are also the parts of the flower that are most likely to be used for social health. They are also the parts of the flower that are most likely to be used for financial health. They are also the parts of the flower that are most likely to be used for environmental health. They are also the parts of the flower that are most likely to be used for global health. They are also the parts of the flower that are most likely to be used for human health. They are also the parts of the flower that are most likely to be used for animal health. They are also the parts of the flower that are most likely to be used for plant health. They are also the parts of the flower that are most likely to be used for ecosystem health. They are also the parts of the flower that are most likely to be used for planet health. They are also the parts of the flower that are most likely to be used for universe health. They are also the parts of the flower that are most likely to be used for everything health.

**flower**

Flower, reproductive organ of most seed-bearing plants. The flower is the part of the plant that produces the seeds. It is made up of the petals, sepals, stamens, and pistil. The petals are the colorful parts of the flower that attract insects and other animals. The sepals are the green parts of the flower that protect the petals. The stamens are the male parts of the flower. The pistil is the female part of the flower. It is made up of the ovary, style, and stigma. The ovary contains the ovules, which are the eggs. The style is the tube that connects the ovary to the stigma. The stigma is the part of the flower that catches the pollen. The pollen is the male part of the flower. It is made up of the anther and the filament. The anther is the part of the stamen that produces the pollen. The filament is the part of the stamen that holds the anther. The flower is made up of the petals, sepals, stamens, and pistil.

sepal sepals

The sepals, the whorled whorl, together are called the calyx. In the flower bud, the sepal partly overlaps and protect the petals, stamens, and pistil from wet or insects. The sepals called as the flower leaves and often resemble small green leaves of the flower's base. In some flowers, the sepals are colored and work with the petals to attract pollinators.

flower

Flower, reproductive organ of most seed-bearing plants. Flowers vary not only in the number and shape of their parts but also in the way they are arranged. In most flowers, the male and female sex parts are arranged in a whorl around the central axis. In some flowers, the male and female parts are arranged in a whorl around the central axis. In some flowers, the male and female parts are arranged in a whorl around the central axis. In some flowers, the male and female parts are arranged in a whorl around the central axis.

## flower

flower, reproductive organ of most seed-bearing plants. Flowers carry a weather-resistant anther or insect-pollinator, all flowers produce the male or female gametes that fuse to form the zygote. There are more than 240,000 species of flowering plants, and they are more widespread than any other group of plants. It is their diverse reproduction, however, that makes them so important to the world's ecosystem. Flowers play diverse roles in the world's ecosystem.
