

Программная инженерия

Лекция
1

Каф. ИСЭ, доц. Абдулаев Вячеслав
Ибрагимович

Литература

Основна

1. **Д.В.Кознов , Я.А Кириленко, Бугайченко Д.Ю. Введение в программную инженерию.** Изд-во Санкт- Петербургского ун-та, 2009 г.,
2. **Иан Соммервилл Инженерия программного обеспечения.** 6-е изд. Перевод с англ., 2002г.
3. **Software engineering / Ian Sommerville.** — 9th ed, 2011г.

Дополнительн

4. **Software engineering / Ivan Marsic, 2012**

Цели лекции

1. Что такое «Программная инженерия» и почему она важна.
2. Знать ответы на ключевые вопросы о программной инженерии
3. Понимать этические и профессиональные проблемы, стоящие

Цели и виды деятельности программной инженерии

Бизнес-реинжиниринг (business reengineering) – в широком смысле обозначает модернизацию бизнеса в определенной компании, внедрение новых практик, поддерживаемых соответствующими, новыми информационными системами.

Информатика (computer science) – это свод теоретических наук, основанных на математике и посвященных формальным основам вычислимости. Сюда относятся математическую логику, теорию грамматик, методы построения компиляторов, математические формальные методы, используемые в верификации и модельном тестировании и т.д.

Системотехника (system engineering) объединяет различные инженерные дисциплины по разработке всевозможных искусственных систем. Часто ПО оказывается частью таких систем и участвуя в их создании, программисты вынуждены глубоко разбираться в особенностях соответствующей аппаратуры.

Определение. Будем понимать под **программным обеспечением** (ПО) множество развивающихся во времени логических предписаний, с помощью которых некоторый коллектив людей управляет и использует многопроцессорную и распределенную систему вычислительных устройств. (Харальд Милс, IBM)

1. Логические предписания – это не только сами программы, но и различная документация (например, по эксплуатации программ) и шире – определенная система отношений между людьми, использующими эти программы в рамках некоторого процесса деятельности.
2. Современное ПО предназначено, как правило, для одновременной работы с многими пользователями, которые могут быть значительно удалены друг от друга в физическом пространстве. Таким образом, вычислительная среда (персональные компьютеры, сервера и т.д.), в которой ПО функционирует, оказывается распределенной.

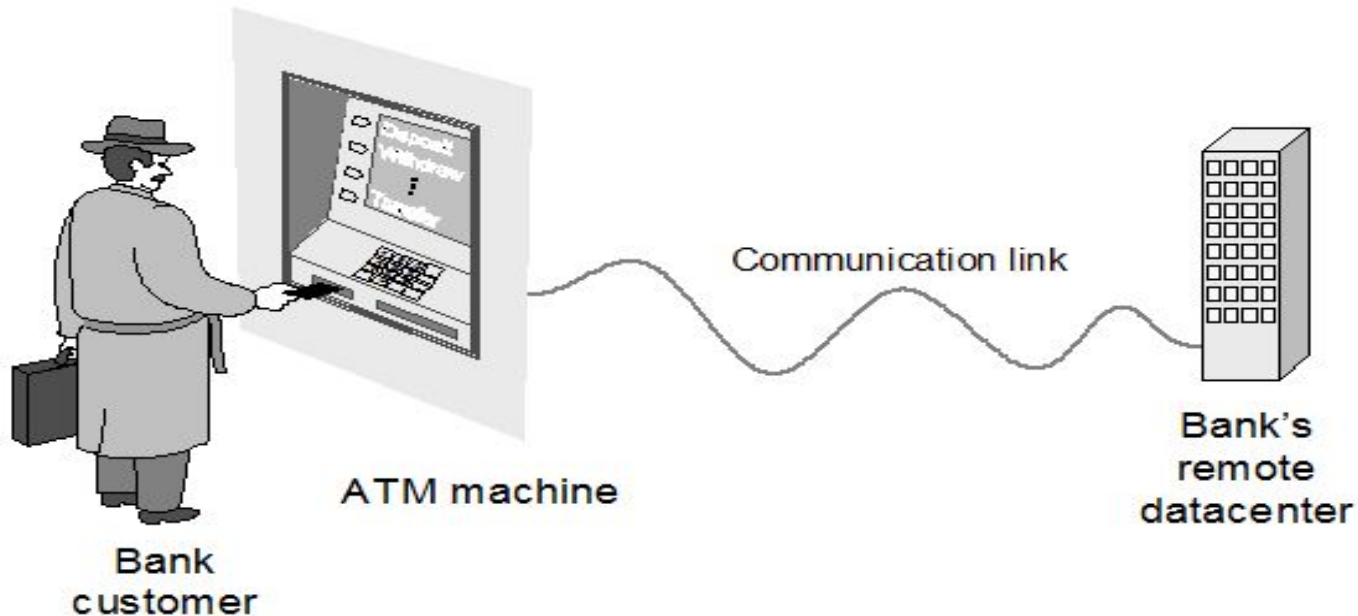

Организация электронного документооборота на уровне регионального и муниципальных органов управления образованием

2. Современное ПО предназначено, как правило, для одновременной работы с многими пользователями, которые могут быть значительно удалены друг от друга в физическом пространстве. Таким образом, вычислительная среда (персональные компьютеры, сервера и т.д.), в которой ПО функционирует, считается распределенной.

Example: ATM Machine

Understanding the money-machine problem:

3. Задачи решаемые современным ПО, часто требуют различных вычислительных ресурсов в силу различной специализации этих задач, из-за большого объема выполняемой работы, а также из соображений безопасности. Например, появляется сервер базы данных, сервер приложений и пр. Таким образом, вычислительная среда, в которой ПО функционирует, оказывается многопроцессорной.

4. ПО развивается во времени – исправляются ошибки, добавляются новые функции, выпускаются новые версии, меняется его аппаратная база.

Свойства ПО

- **Сложность** программных объектов
- **Согласованность** – ПО должно быть согласовано с большим количеством интерфейсов, с которыми впоследствии оно должно взаимодействовать.
- **Изменяемость** – ПО легко изменить и, как следствие, требования к нему постоянно меняются в процессе разработки.
- **Нематериальность** – ПО невозможно увидеть, оно виртуально.

SOFTWARE ENGINEERING

Ninth Edition

Ian Sommerville

Software engineering

- ✧ The economies of ALL developed nations are dependent on software.
- ✧ More and more systems are software controlled
- ✧ Software engineering is concerned with theories, methods and tools for professional software development.
- ✧ Expenditure on software represents a significant fraction of GNP in all developed countries.

Software costs

- ✧ Software costs often dominate computer system costs. The costs of software on a PC are often greater than the hardware cost.
- ✧ Software costs more to maintain than it does to develop. For systems with a long life, maintenance costs may be several times development costs.
- ✧ Software engineering is concerned with cost-effective software development.

Software products

❖ Generic products

- Stand-alone systems that are marketed and sold to any customer who wishes to buy them.
- Examples – PC software such as graphics programs, project management tools; CAD software; software for specific markets such as appointments systems for dentists.

❖ Customized products

- Software that is commissioned by a specific customer to meet their own needs.
- Examples – embedded control systems, air traffic control software, traffic monitoring systems.

Product specification

- ✧ Generic products (Продукты на общий рынок)
 - The specification of what the software should do is owned by the software developer and decisions on software change are made by the developer.
- ✧ Customized products (Продукты для заказчика)
 - The specification of what the software should do is owned by the customer for the software and they make decisions on software changes that are required.

Frequently asked questions about software engineering

| Question | Answer |
|---|---|
| What is software? | Computer programs and associated documentation. Software products may be developed for a particular customer or may be developed for a general market. |
| What are the attributes of good software? | Good software should deliver the required functionality and performance to the user and should be maintainable, dependable and usable. |
| What is software engineering? | Software engineering is an engineering discipline that is concerned with all aspects of software production. |
| What are the fundamental software engineering activities? | Software specification, software development, software validation and software evolution. |
| What is the difference between software engineering and computer science? | Computer science focuses on theory and fundamentals; software engineering is concerned with the practicalities of developing and delivering useful software. |
| What is the difference between software engineering and system engineering? | System engineering is concerned with all aspects of computer-based systems development including hardware, software and process engineering. Software engineering is part of this more general process. |

Frequently asked questions about software engineering

| Question | Answer |
|--|--|
| What are the key challenges facing software engineering? | Coping with increasing diversity, demands for reduced delivery times and developing trustworthy software. |
| What are the costs of software engineering? | Roughly 60% of software costs are development costs, 40% are testing costs. For custom software, evolution costs often exceed development costs. |
| What are the best software engineering techniques and methods? | While all software projects have to be professionally managed and developed, different techniques are appropriate for different types of system. For example, games should always be developed using a series of prototypes whereas safety critical control systems require a complete and analyzable specification to be developed. You can't, therefore, say that one method is better than another. |
| What differences has the web made to software engineering? | The web has led to the availability of software services and the possibility of developing highly distributed service-based systems. Web-based systems development has led to important advances in programming languages and software reuse. |

Essential attributes of good software

| Product characteristic | Description |
|----------------------------|--|
| Maintainability | Software should be written in such a way so that it can evolve to meet the changing needs of customers. This is a critical attribute because software change is an inevitable requirement of a changing business environment. |
| Dependability and security | Software dependability includes a range of characteristics including reliability, security and safety. Dependable software should not cause physical or economic damage in the event of system failure. Malicious users should not be able to access or damage the system. |
| Efficiency | Software should not make wasteful use of system resources such as memory and processor cycles. Efficiency therefore includes responsiveness, processing time, memory utilisation, etc. |
| Acceptability | Software must be acceptable to the type of users for which it is designed. This means that it must be understandable, usable and compatible with other systems that they use. |

Software engineering

- ✧ Software engineering is an engineering discipline that is concerned with all aspects of software production from the early stages of system specification through to maintaining the system after it has gone into use.
- ✧ Engineering discipline
 - Using appropriate theories and methods to solve problems bearing in mind organizational and financial constraints.
- ✧ All aspects of software production
 - Not just technical process of development. Also project management and the development of tools, methods etc. to support software production.

Importance of software engineering

- ✧ More and more, individuals and society rely on advanced software systems. We need to be able to produce reliable and trustworthy systems economically and quickly.
- ✧ It is usually cheaper, in the long run, to use software engineering methods and techniques for software systems rather than just write the programs as if it was a personal programming project. For most types of system, the majority of costs are the costs of changing the software after it has gone into use.

Software process activities

- ✧ Software specification, where customers and engineers define the software that is to be produced and the constraints on its operation.
- ✧ Software development, where the software is designed and programmed.
- ✧ Software validation, where the software is checked to ensure that it is what the customer requires.
- ✧ Software evolution, where the software is modified to reflect changing customer and market requirements.

General issues that affect most software

✧ Heterogeneity

- Increasingly, systems are required to operate as distributed systems across networks that include different types of computer and mobile devices.

✧ Business and social change

- Business and society are changing incredibly quickly as emerging economies develop and new technologies become available. They need to be able to change their existing software and to rapidly develop new software.

✧ Security and trust

- As software is intertwined with all aspects of our lives, it is essential that we can trust that software.

Software engineering diversity

- ✧ There are many different types of software system and there is no universal set of software techniques that is applicable to all of these.
- ✧ The software engineering methods and tools used depend on the type of application being developed, the requirements of the customer and the background of the development team.

Software engineering ethics

- ❖ Software engineering involves wider responsibilities than simply the application of technical skills.
- ❖ Software engineers must behave in an honest and ethically responsible way if they are to be respected as professionals.
- ❖ Ethical behaviour is more than simply upholding the law but involves following a set of principles that are morally correct.

Issues of professional responsibility

✧ Confidentiality

- Engineers should normally respect the confidentiality of their employers or clients irrespective of whether or not a formal confidentiality agreement has been signed.

✧ Competence

- Engineers should not misrepresent their level of competence. They should not knowingly accept work which is outwith their competence.

Issues of professional responsibility

✧ Intellectual property rights

- Engineers should be aware of local laws governing the use of intellectual property such as patents, copyright, etc. They should be careful to ensure that the intellectual property of employers and clients is protected.

✧ Computer misuse

- Software engineers should not use their technical skills to misuse other people's computers. Computer misuse ranges from relatively trivial (game playing on an employer's machine, say) to extremely serious (dissemination of viruses).

ACM/IEEE Code of Ethics

- ✧ The professional societies in the US have cooperated to produce a code of ethical practice.
- ✧ Members of these organisations sign up to the code of practice when they join.
- ✧ The Code contains eight Principles related to the behaviour of and decisions made by professional software engineers, including practitioners, educators, managers, supervisors and policy makers, as well as trainees and students of the profession.

Association for Computing Machinery (ACM)

Institute of Electrical and Electronics Engineers (IEEE)

The ACM/IEEE Code of Ethics

Software Engineering Code of Ethics and Professional Practice

ACM/IEEE-CS Joint Task Force on Software Engineering Ethics and Professional Practices

PREAMBLE

The short version of the code summarizes aspirations at a high level of the abstraction; the clauses that are included in the full version give examples and details of how these aspirations change the way we act as software engineering professionals. Without the aspirations, the details can become legalistic and tedious; without the details, the aspirations can become high sounding but empty; together, the aspirations and the details form a cohesive code.

Software engineers shall commit themselves to making the analysis, specification, design, development, testing and maintenance of software a beneficial and respected profession. In accordance with their commitment to the health, safety and welfare of the public, software engineers shall adhere to the following Eight Principles:

Ethical principles

1. PUBLIC - Software engineers shall act consistently with the public interest.
2. CLIENT AND EMPLOYER - Software engineers shall act in a manner that is in the best interests of their client and employer consistent with the public interest.
3. PRODUCT - Software engineers shall ensure that their products and related modifications meet the highest professional standards possible.
4. JUDGMENT - Software engineers shall maintain integrity and independence in their professional judgment.
5. MANAGEMENT - Software engineering managers and leaders shall subscribe to and promote an ethical approach to the management of software development and maintenance.
6. PROFESSION - Software engineers shall advance the integrity and reputation of the profession consistent with the public interest.
7. COLLEAGUES - Software engineers shall be fair to and supportive of their colleagues.
8. SELF - Software engineers shall participate in lifelong learning regarding the practice of their profession and shall promote an ethical approach to the practice of the profession.

Ethical dilemmas

- ✧ Disagreement in principle with the policies of senior management.
- ✧ Your employer acts in an unethical way and releases a safety-critical system without finishing the testing of the system.
- ✧ Participation in the development of military weapons systems or nuclear systems.
