

# Endangered SPECIES

# Siberian tiger

Siberian or Amur Tigers inhabit forests of Western and Central Asia and eastern Russia. Siberian Tigers are found mostly in cold land, covered with snow for most of the year.

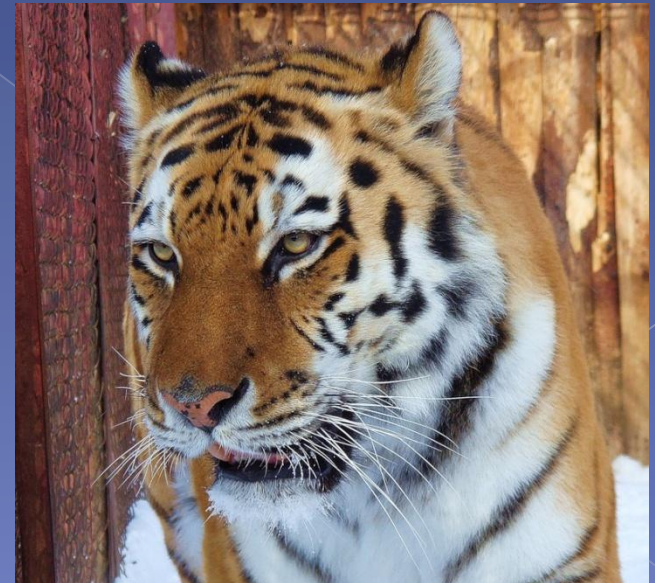

Over the last hundred years, hunting and forest destruction have reduced tiger populations.

Tigers are hunted for body parts that are used in traditional Chinese medicine.

Russia has many laws for the animal's preservation. Russia enforces these laws well. Conservation efforts must be maintained. Russian government establishes "Econet to protect the habitat for the tigers and anti-poaching patrols in the Russian Far East."

# ARCTIC FOX

In winter, the arctic fox is white, but in summer its coat becomes thinner and changes to a blue-grey colour.

The arctic fox can be found all around the Arctic. It is endangered because people hunt it for its fur. They don't find enough food to eat.

With conservation measures, financial and public support, the future for the arctic fox will begin to turn a corner.

# Polar bear

The **polar bear** inhabits the Arctic circle and its surrounding seas and land masses.

The polar bear is the first animal to become endangered because of global warming and shrinking pack ice.

## What can we do?

- stop fishing in the Arctic
- recycle
- reuse
- cut down on our waste

# Red Wolf

It is the rarest and most endangered animal. It can be found in the south of the Far East. It is endangered because of habitat destruction and loss of its food (deer) due to hunting.

This animal is poorly studied but there is *The Red Wolf Society* which takes care of red wolves.

# Snow Leopard

# leopard

tarsius
